

Rose — Amazon DSP Program Manager Mock Interview Coach

An in-browser AI interview coach who plays your Amazon hiring-manager, listens to your spoken answers, and scores them against the Leadership-Principles bar. Everything runs **locally in your browser** — recordings, transcripts, and scores never leave your device.

> **Your live URL (once deployed):** ``https://scaruana33-code.github.io/mock-interview/``

🚀 Go live at your exact URL (auto-deploy, ~5 min)

This package includes a GitHub Actions workflow that **auto-publishes to your Pages URL** every time you push.

1. Sign in to GitHub as **scaruana33-code** and create a new **public** repository named exactly **`mock-interview`** (the repo name is what makes the URL end in ``/mock-interview/``).
2. **Add file → Upload files** and drag in **all** files from this package, keeping the folder structure — including the hidden ``.nojekyll`` and ``.github/workflows/deploy.yml``. Commit to the **main** branch.
3. **Settings → Pages → Build and deployment → Source** → choose **GitHub Actions**.
4. In ~1–2 minutes Rose is live at **``https://scaruana33-code.github.io/mock-interview/``**.
5. Open it, **Allow** the microphone, and start recording. 🎤

> Uploading the two dot-files: GitHub's web uploader keeps folder paths if you drag the whole folder in. If a file won't upload alone, use **Add file → Create new file** and type the path (e.g. ``.github/workflows/deploy.yml``) to recreate it, then paste the contents.

🧠 What Rose does

1. **Listens** — hit **Record** and Rose transcribes your answer live (browser speech-to-text).
2. **Scores you 0–5** on the five things an Amazon bar-raiser grades:
STAR structure · Ownership ("I" vs "we") · Data/metrics · Quantified result · Maps to the principle.
3. **Delivers a verdict** — overall score, a **Strong Hire / Hire / Lean No / No Hire** call, strengths & fixes, pacing note, filler-word count, and the **follow-up probe** she'd ask next.

Best experience is **Chrome or Edge**. In any browser you can also paste/edit a transcript.

📱 Scan-to-phone QR code

The left panel shows a **QR code** to your live URL — scan it with your phone camera to open

Rose and practice out loud on the go. There's a **Copy link** button too, and a standalone `rose-qr-code.png` is included in this package.

📄 Export debrief to PDF
Click **Export debrief to PDF** to compile every scored take — Rose's score and Hire call, the five rubric scores, strengths/fixes, pacing, transcript, and your notes — into one printable page. In the print dialog, choose **Save as PDF**.

📁 Download my data (JSON backup)
Exports all your takes/scores as a JSON file so you never lose progress if you switch devices or clear your browser.

Files in this package

File	Purpose
<code>`index.html`</code>	The entire app, including Rose, the QR panel, PDF export, and JSON backup.
<code>`rose-qr-code.png`</code>	Standalone QR to your live URL (print/share).
<code>`.github/workflows/deploy.yml`</code>	Auto-deploys to your GitHub Pages URL on every push.
<code>`.nojekyll`</code>	Lets GitHub Pages serve files as-is.
<code>`staticwebapp.config.json`</code>	Config for Azure Static Web Apps (mic permission + routing).
<code>`netlify.toml`</code>	Config for Netlify drag-and-drop (mic permission).
<code>`README.md`</code>	This file.

Test locally first (optional)

```
``bash
python -m http.server 8000      # then open http://localhost:8000
```

``localhost`` is a secure origin, so the mic and Rose's speech-to-text work.

Privacy

All audio, transcripts, and scores live only in your browser's `localStorage` on the device you use. Nothing is uploaded. **Reset** in the app (or clearing browser data) erases it.
